Outline

- General Characteristics of Avatrel® Photodefinable Polymers
  - Chemical Structure
  - Low Shrinkage
  - Wafer Stress
  - Planarity
  - General Imaging
  - Applications
- Redistribution Layer (RDL) Device Build
- Reliability Testing
- Summary

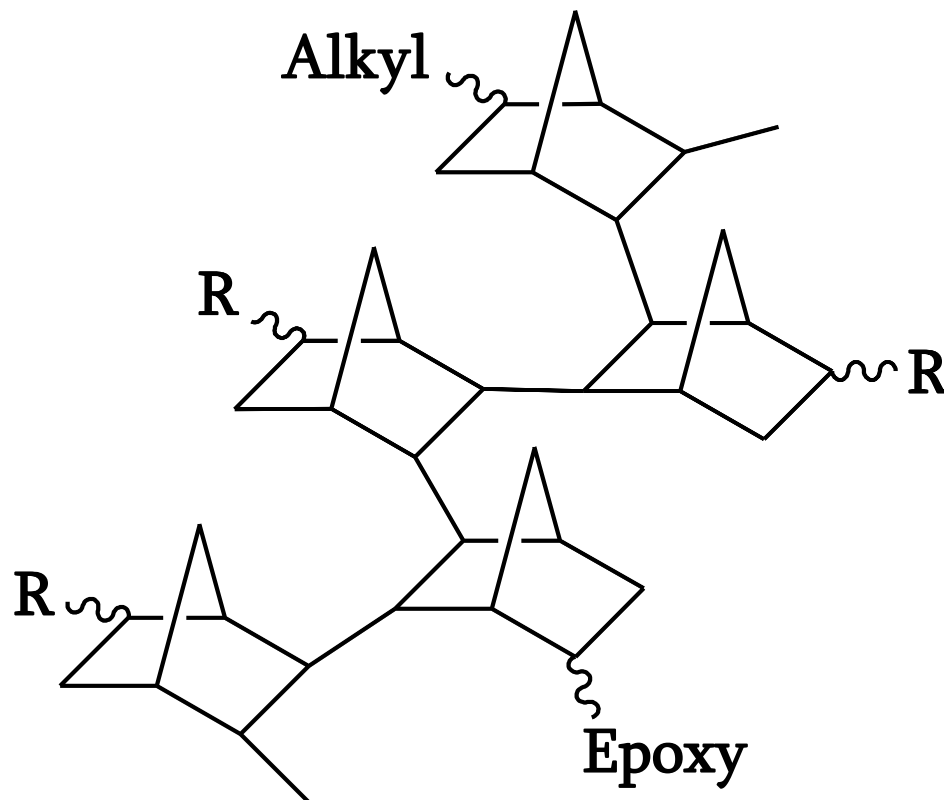
Synergies of Chemistry in Polycyclic Polyolefins

Polynorbornene

- High T_g From Backbone
- Alkyl – Tune Modulus/Stress
- Low Moisture Absorption
- Isotropic Properties
- Transparency
- Low Dielectric Constant

Epoxy

- Accepted Chemistry
- Low Temperature Cure
- Adhesion
- Photosensitive



Low Film Thickness Shrinkage through Wafer Processing

- 1400 rpm, Cyclopentanone develop, 180°C/2h cure

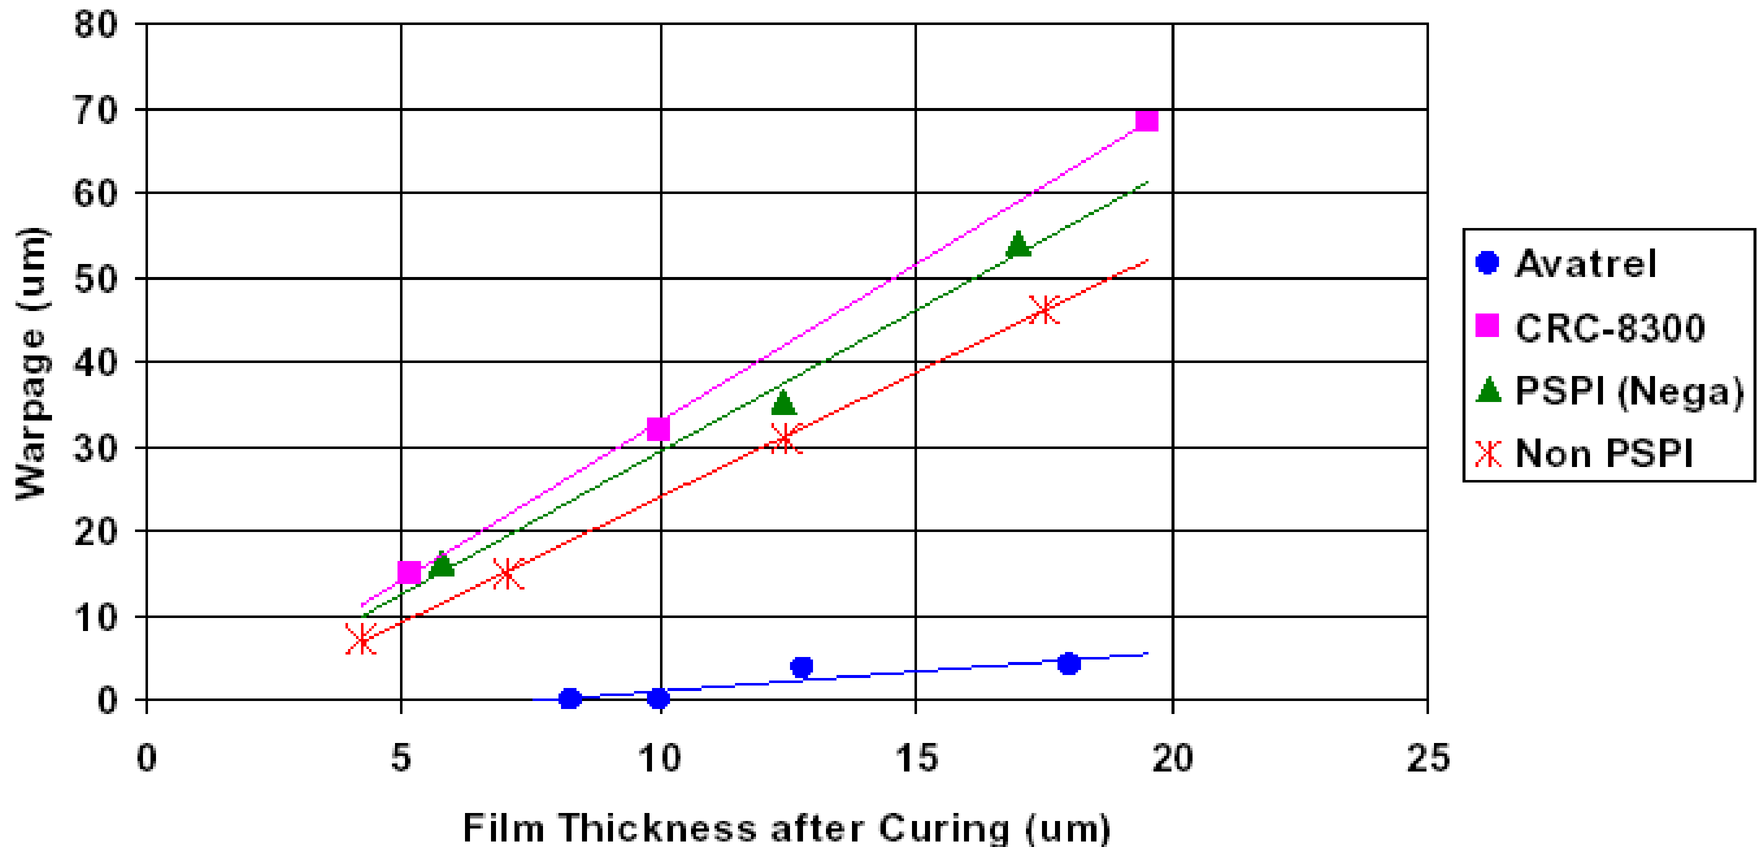
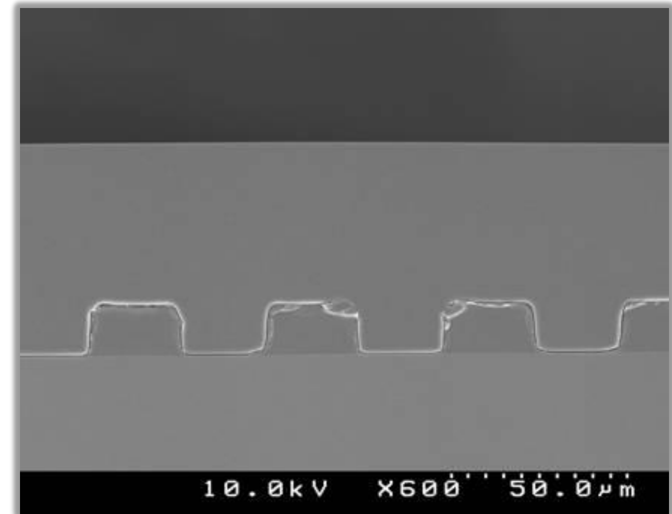
Low Wafer Warpage with Simple Coatings

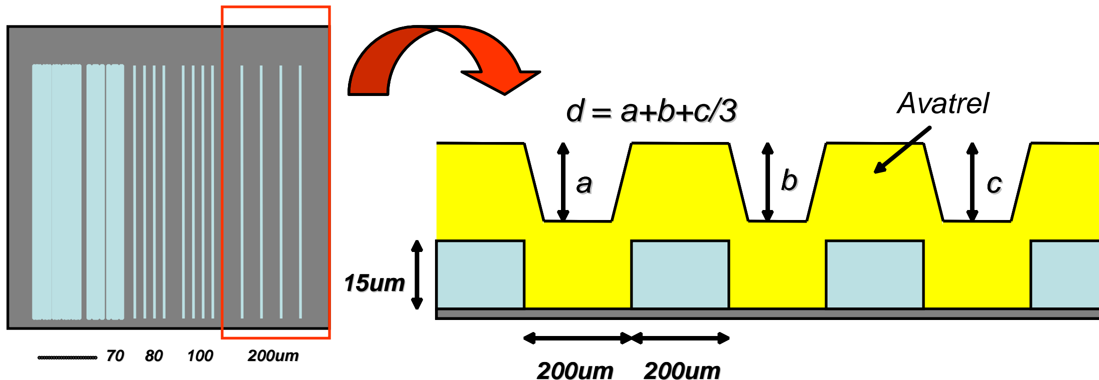


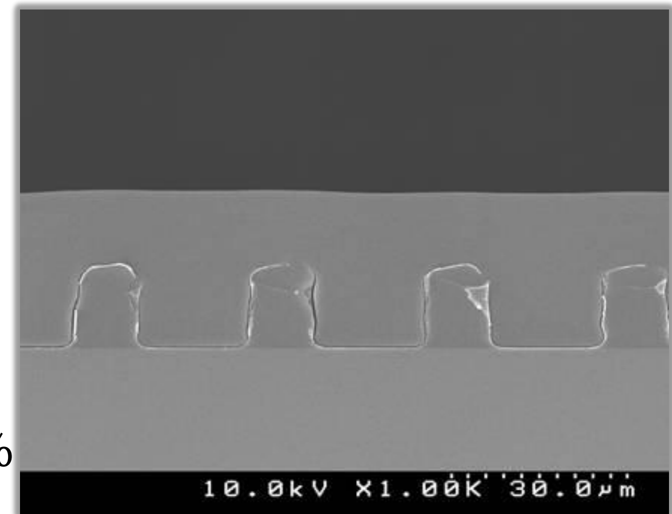
- Wafer: 200 mm Si Wafer
- Thickness: 625 µm
- Measuring span: 100 mm

Planarization of Avatrel over Topology

- Avatrel has good planarization with dense feature patterns
  - Planarization is very good for 60 μm thick films on 7 & 15 μm topology, 100% DOP
  - Planarization is 85 to 96% DOP for 30 μm thick films on 7 μm topology
  - Planarization is 75 to 82% DOP for 30 μm thick films on 15 μm topology







% DOP (degree of planarization) = (1–d/step height) x 100%

General Imaging Capability of Avatrel® Polycyclic Polyolefins

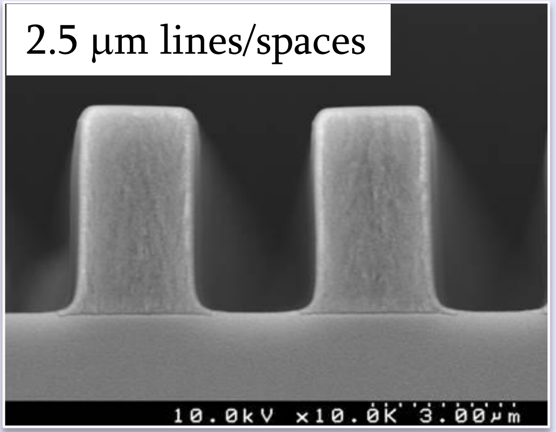
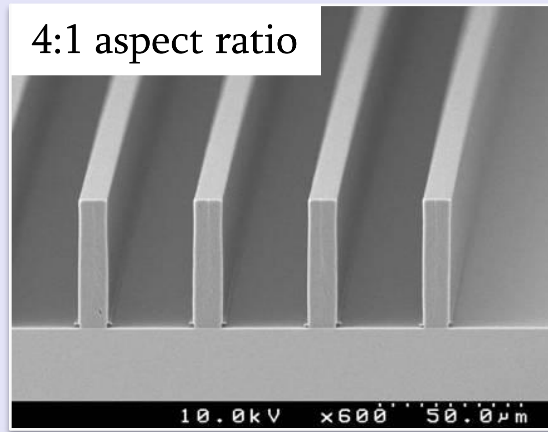
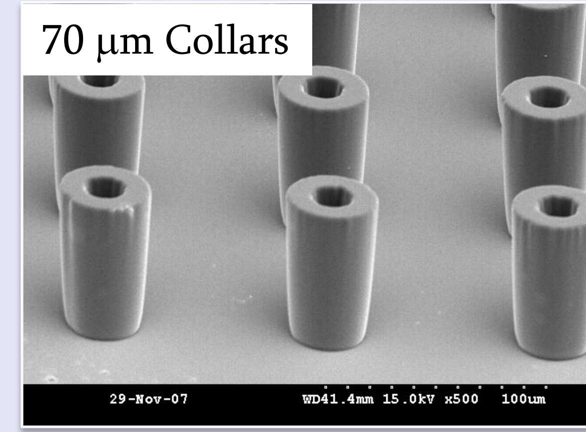
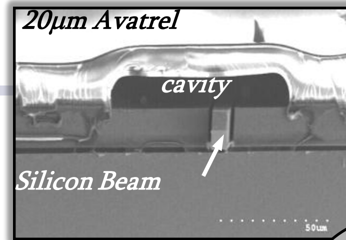
Aqueous Developable

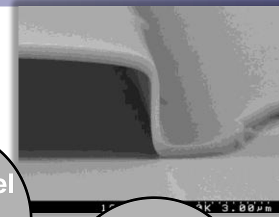


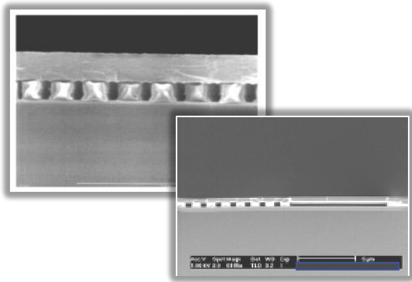


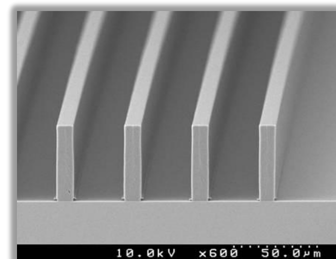


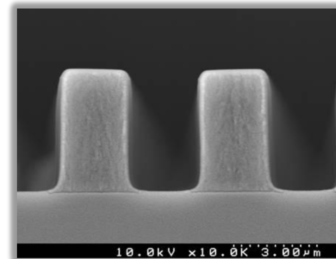
Avatrel®/Unity® Applications

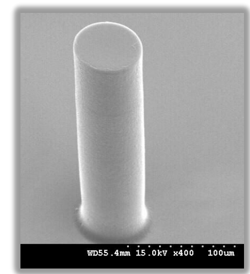


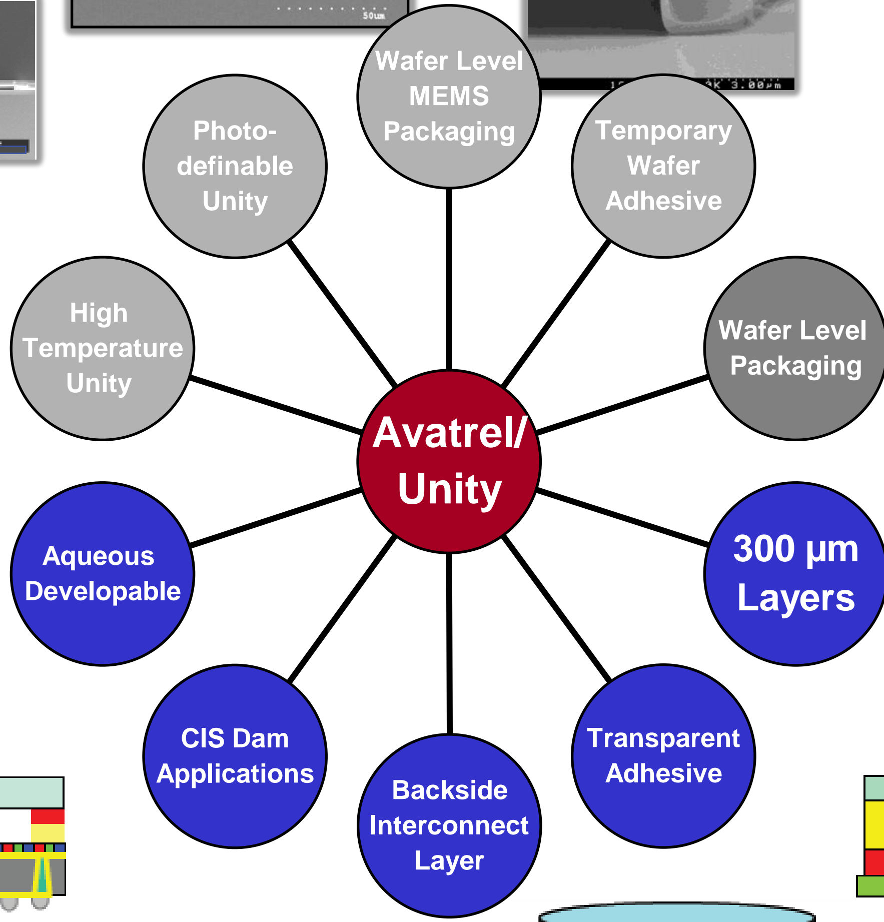


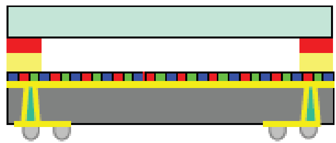


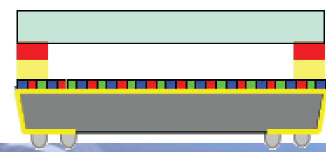


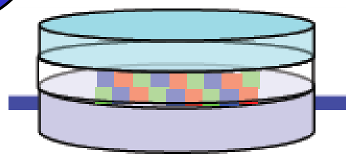


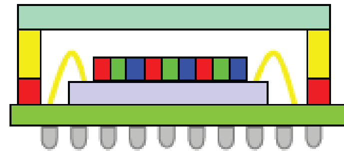












Motivation for Redistribution Materials

- A material which aids in the relocation of bond pads
- Desirability stems from small package size, high-speed electrical access, and ability to accommodate standard pad layouts
- RDL WL-CSP is often used in miniaturized consumer electronic products
  - Cell phones consume 80-90% of all WL-CSP packages
- Redistribution is the most popular WL-CSP
  - >90% of the 6.1 Bn WL-CSP packages shipped in 2007 used RDLs
- As processors move to multi-core designs, clock redistribution may be required

Property Comparison of Redistribution Materials

Process Flow for RDL Device Build

Metal-1

1a) Passivated Copper Wafers
1b) Coat with Resist
1c) Photo/Etch

Polymer-1

2) Pattern Layer-1 of Avatrel-RDL

Metal-2

3a) Copper Seed Layer Deposition
3b) Coat with Plating Resist
3c) Copper Electroplating
3d) Resist Strip and Seed Layer Etch

Polymer-2

4) Pattern Layer-2 of Avatrel-RDL

Metal-3

5a) Deposition of Nickel/Gold
5b) Photo/Etch

Step 1a: Copper Wafers over Passivation Layer

- Copper (5000Å) on SiOx or Si_3N_4

Si-wafer
Passivation
Copper

Standard Process for the Imaging of Avatrel® Redistribution Material

Wafer Process Conditions

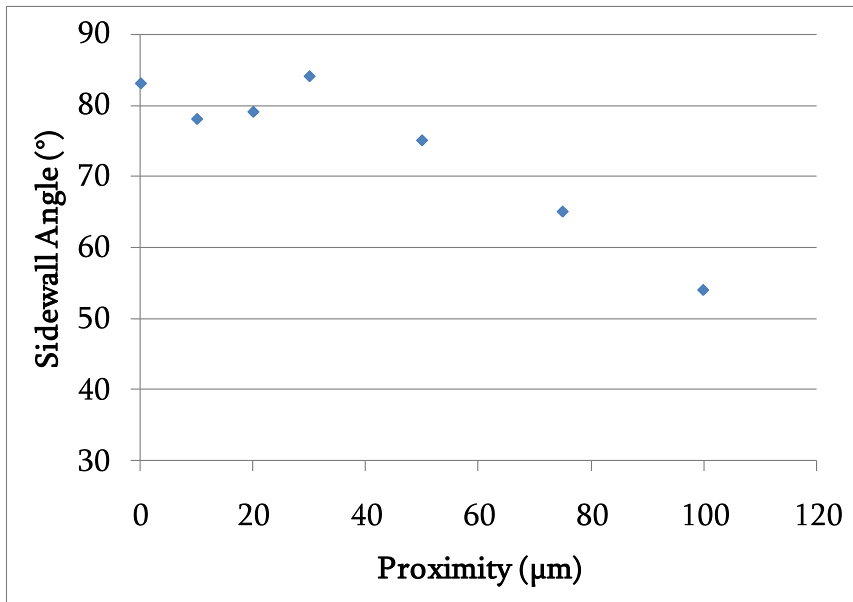
- Dehydration Hydration Bake: 130°C/2 min
- Plasma Pretreatment: 50/50 Ar/O_2, 300 W, 30 sec
- Spin-coat
- Prebake: 120°C/5 min
- Exposure: 300-800 mJ/cm^2
- Post-Exposure Bake: 90°C/4 min
- Develop: Cyclopentanone, 20 sec
- Cure: 180°C/2h

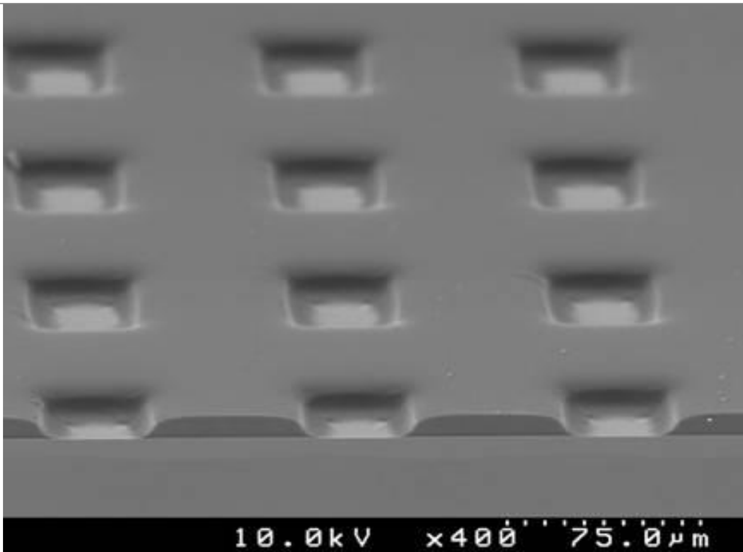
Inducing Sidewall Slope

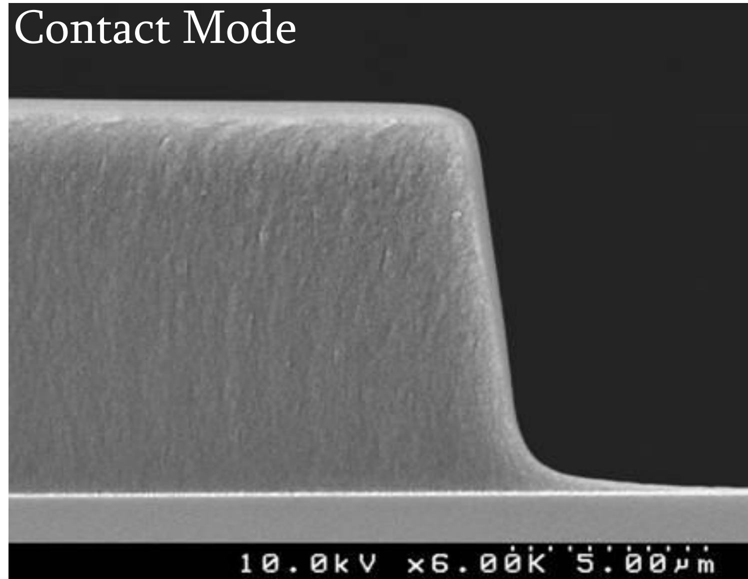
- Proximity
- DOF
- Polymer
- Formulation

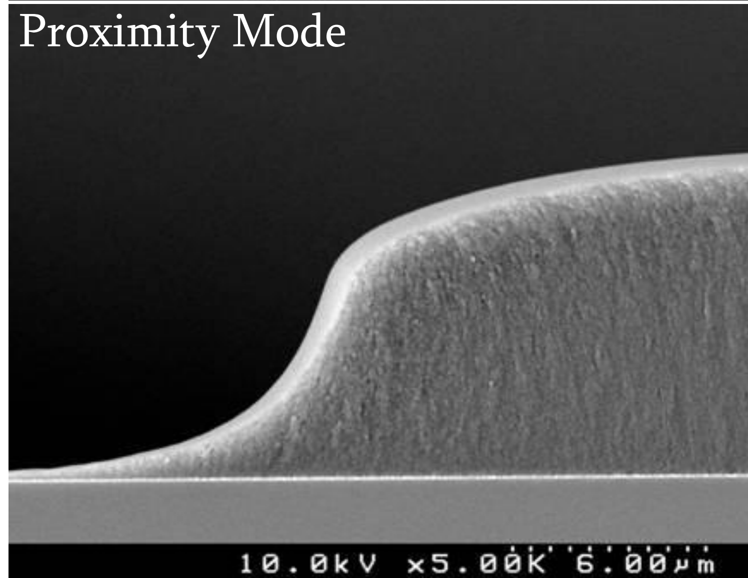
Step 2 Details: Sidewall Imaging in Proximity Mode on Aligner

- 300 mJ/cm^2 on Copper

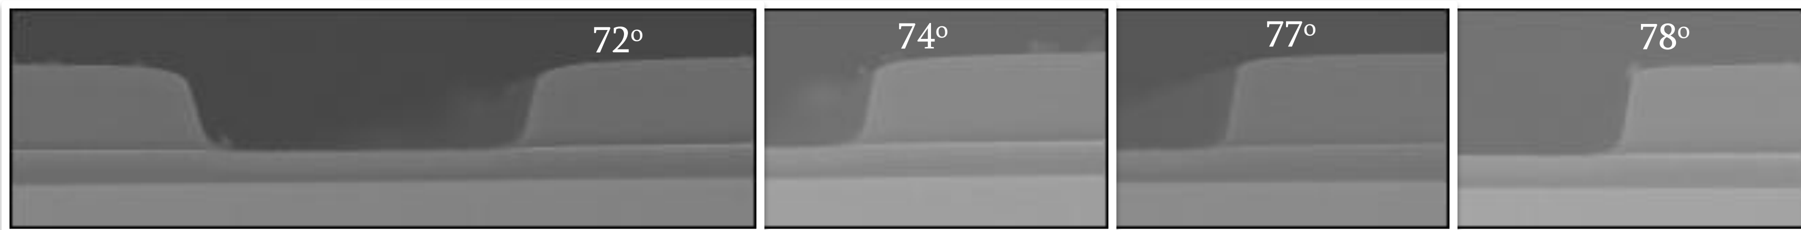


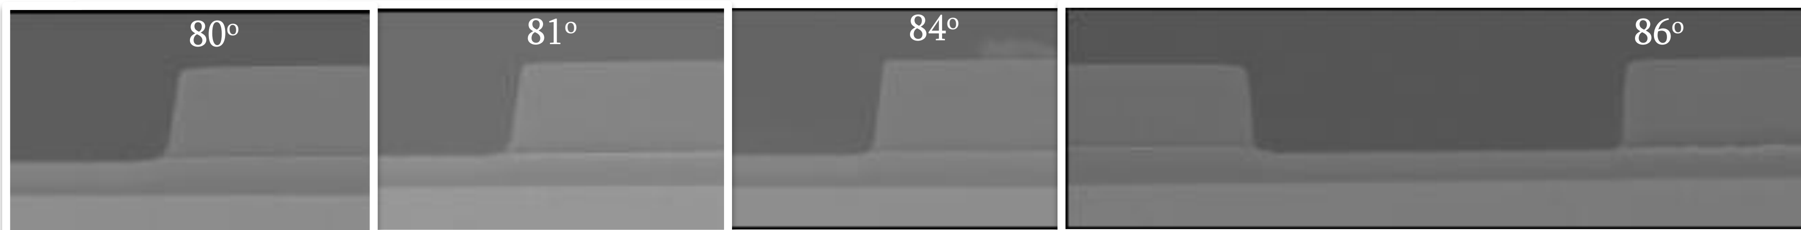


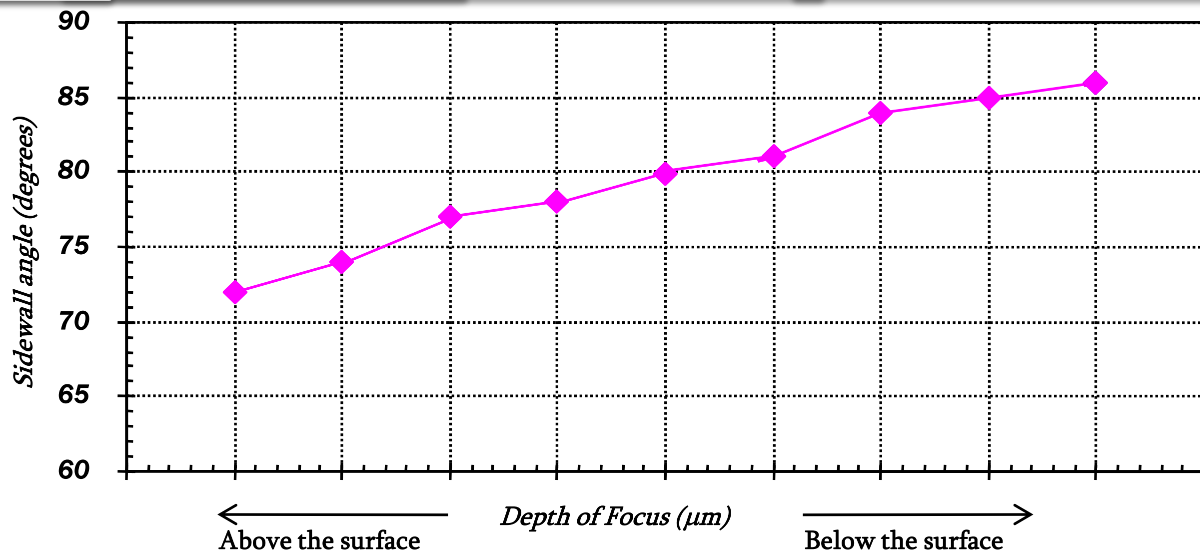




Step 2 Details: Tunable Sidewall using Depth of Focus on Stepper

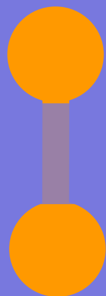


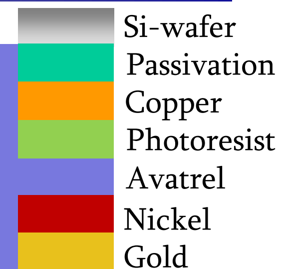




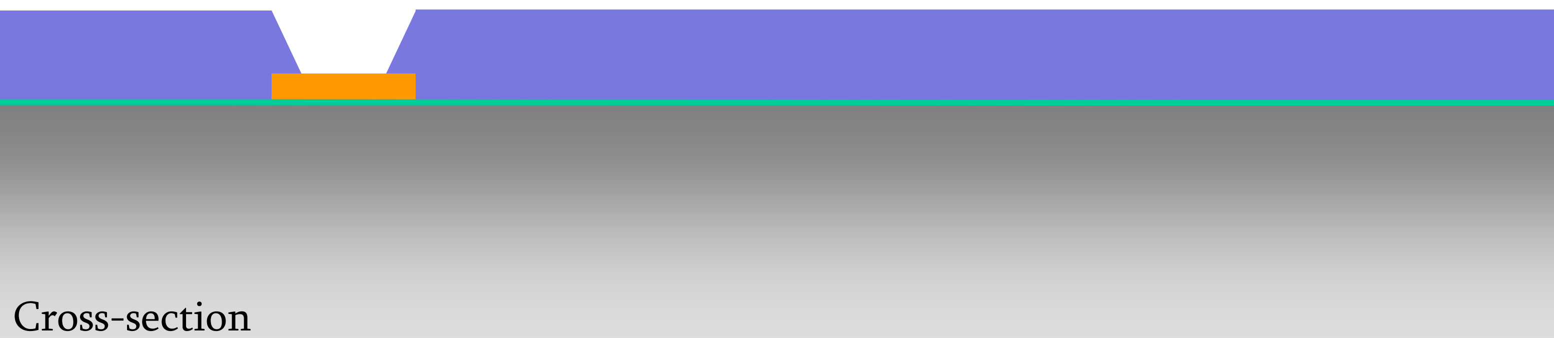
Step 2: 1st Layer of Avatrel Processed

Top Down





~150 µm



Step 3a: Deposited Conductive Seed Layer for Electroplating

- Sputtered Copper, 1000Å

Summary

- Avatrel® Redistribution Material
  - Thermal Properties: high T_g, good stability
  - Electrical Properties: low CTE and low dielectric constant
  - Wafer Properties: low shrinkage and low residual stress
  - Imaging: thick film, high aspect ratio, tunable sidewall angle
  - Low Temperature Curability
- RDL devices have been successfully fabricated with positive reliability results
- Commercial qualification is ongoing
- Aqueous versions are being developed
